

Vacuum-Insulated Mug Test

Contenders:

- Contigo AutoSeal 16oz (holds 16oz with lid on)
- SubZero Hot/Cold Bottle 20oz (holds 20oz with lid on)
- Yeti Rambler 20oz (holds 16.5oz with lid on)

For this test I put the same amount of ice (8.8 ounces by weight or 250ml of water before freezing) into each mug. I then put the lids on and left them in a corner of my basement (about 75°) for 24 hours.

After sitting for a day all 3 mugs appeared to have about half the ice left in the mugs, so to determine exactly how much ice had melted I poured off the water from each mug and measured it. You can see the results in the photos below.
